

# CONTENTS

<b>1. Introduction</b>	<b>5</b>
1.1. Overview on the issue of the modelling of construction elements with variable properties	5
1.2. Scope of the monograph	9
<b>2. Dynamical stability of variable cross section bars – first natural frequencies and buckling critical forces</b>	<b>13</b>
2.1. Introduction	13
2.2. The finite element method in the problems of dynamical buckling	17
2.3. Bar CC	20
2.3.1. Bending stiffness variability of the type $f(x^4)$	20
2.3.2. Bending stiffness variability of the type $f(x^3)$	22
2.3.3. Bending stiffness variability of the type $f(x)$	26
2.4. Bar PC	29
2.4.1. Bending stiffness variability of the type $f(x^4)$	30
2.4.2. Bending stiffness variability of the type $f(x^3)$	31
2.4.3. Bending stiffness variability of the type $f(x)$	34
2.5. Bar CP	36
2.5.1. Bending stiffness variability of the type $f(x^4)$	36
2.5.2. Bending stiffness variability of the type $f(x^3)$	38
2.5.3. Bending stiffness variability of the type $f(x)$	40
2.6. Curves $\lambda$ - $\sigma$ for various types of bars	43
2.7. Comparison of results with the literature data	44
2.8. Convergence analysis	59
2.9. Conclusions	60
<b>3. Stability and vibrations of microheterogeneous plate band resting on elastic subsoil</b>	<b>63</b>
3.1. Introduction	63
3.2. Basic assumptions	66
3.3. Transformation formulas of a band element	67
3.4. Element (cell) stiffness matrix	68
3.5. Band stiffness matrix	74

3.6. Calculation of the values of natural frequency and critical buckling force – examples .....	77
3.6.1. Example 1 .....	78
3.6.2. Example 2 .....	79
3.6.3. Example 3 .....	80
3.6.4. Example 4 .....	81
3.6.5. Comparative diagrams .....	82
3.7. Conclusions .....	83
<b>4. Free vibrations of non-homogeneous plates – application of the tolerance averaging technique .....</b>	<b>85</b>
4.1. Introduction .....	85
4.2. Description of system .....	86
4.3. Equations of motion. Averaging tolerance technique .....	87
4.4. Shape function .....	90
4.5. Computational example .....	95
4.5.1. Natural frequencies .....	95
4.5.2. Fluctuations and total deflection .....	100
4.6. Conclusions .....	102
<b>5. Method of calculation of non-homogeneous, rotationally symmetric circular plates supported on piles .....</b>	<b>103</b>
5.1. Introduction .....	103
5.2. Description of system, methods and equations .....	105
5.3. Computational examples .....	112
5.3.1. Plate with discontinuous, alternately variable stiffness .....	113
5.3.2. Plate with discontinuously variable stiffness, increasing towards the circumference .....	120
5.3.3. Comparative examples – plates with continuously variable stiffnesses .....	122
5.3.4. Plate supported on two rows of piles .....	125
5.4. Discussion .....	130
5.5. Recapitulation and conclusions .....	133
<b>6. Summary .....</b>	<b>135</b>
<b>References .....</b>	<b>137</b>
